

UTILITY DRILLING TOOLS

Based on our work with experienced installers, Electric City Tooling (ECT) offers utility auger tools with a single type of rock tooth because they offer the best practical advantage, and the difference between dirt and rock teeth is so marginal (with respect to production).

Easy to change and robust, rock bullet teeth reduce the need to carry multiple teeth. Our augers feature an industry-leading 1" lead flight protected with wear pads and 5/16" carry flighting, ensuring durability and long-lasting performance.

ECT also offers core barrels when conditions require rock, cobble, or boulder excavation. We provide barrels in any diameter, all built with wear pads for longer life and access ports to remove difficult plugs. Our teeth, the same as those used on our other augers, are easy to replace when needed, adding to the versatility and convenience of our tooling solutions. This combination is particularly effective for utility and construction projects, offering a single, powerful solution for digging and setting, while maintaining precision and reducing operational time.

Our 26" stowable stand-alone core barrel.
